

Tactical Radio Operation

My opinion is that the best books for radio amateur are the Military Books. The book gives clear information that could understand everyone. No any formulas just practice that needs to know.

Some of the books were written by unknown authors, but the books are excellent for understanding of the amateur radio communications.

I found the book, *Tactical Radio Operational* in the internet and I could advice this one for every ham. The book is in very clear form explains lots of topics on field operation, on field antennas and gives some tips in the hand of the field operator.

Just download the book and read the chapters what you need.
